

Case Study
Oxford University & the
Blavatnik building
July 2015

Developments at Oxford University

Working closely with Oxford University to provide all their metering services for their Earth Sciences Buildings, and the new award-winning Blavatnik Building, situated next to the Maths Institute.

When Oxford University found its heat meters were not working correctly they contacted MWA Technology straight away for help and advice.

MWA carried out an in-depth site survey, provided expert technical advice to rectify the problem, supplied the new meters and inspected all installations to ensure that fittings were accurate for optimum energy performance.

With the well specified and correctly installed meters in place, results included a reduction in energy usage and subsequent cost savings.

MWA Technology and Oxford University continued their close partnership by working on a series of projects, including the supply of heat meters to 5 existing buildings and the newly opened, award-winning Blavatnik building.
